GreenGrid Project: End-to-End Salesforce Transformation Proposal

- **Prepared by** : Dinda Suci Indah Sari (Lead Salesforce Business Analyst)
- **Client** : GreenGrid Utilities
- **Vision** : Eliminating operational silos to create smart, sustainable, and customer-centric energy services.

M5. Security Model and Access Control

The "Project GreenGrid" security model is built on the principle of Least Privilege Access, where each user has access only to the data they absolutely need to perform their job functions. This is crucial given that utility customer data often includes sensitive information such as energy usage history and billing details.

5.1 Role Hierarchy Design

This role hierarchy is designed to reflect GreenGrid's organizational structure while allowing for vertical data flow. Users at the top of the hierarchy will automatically have access to all data held by their subordinates.

- a) **Executive Leadership (CEO/COO/CIO): Has full visibility across the organization for ROI monitoring and strategic pipeline.**
- b) **VP of Global Sales: Oversees all Sales and Customer Account data.**
 - Sales Manager: Accesses Opportunity data from the Sales Reps team under their control.
 - Sales Reps: Have access to the Leads and Opportunities assigned to them.
- c) **Head of Customer Success: Oversees all customer service and satisfaction departments.**
 - Support Supervisors: Monitor agent performance and case escalation.
 - Call Center Agents: Access account, contact, and case data to serve customers.
- d) **Head of Field Operations: Manages field infrastructure and coordination.**
 - Dispatchers: Manages work order scheduling for technicians.
 - Field Technicians: Have limited access to work orders and assets at their assigned location.

5.2 Permission Sets Definition

Due to dynamic operational needs, we will use Permission Sets to grant additional access without having to change the user's base profile.

1. "Energy Meter Specialist": Special permissions to view and edit technical details on the Energy_Meter__c custom object. Granted to senior technicians and energy auditors.

2. "Billing Investigator": Grants read and audit access to the Billing_History__c object. Granted to senior agents handling complex billing complaints.
3. "Field Geo-Tracker": Permission to access Geo_Location__c data on Work Orders for real-time location synchronization. Granted to field technicians and dispatchers.
4. "Contract Approval Pro": Permission to digitally approve new contracts within Salesforce. Granted only to Sales Managers and VPs of Sales.

5.3 Sharing Rules Configuration

This configuration is used to open data access horizontally across departments based on specific criteria.

a) Criteria-Based Sharing Rules:

- SLA-Driven Cases: Cases with "High" priority (such as power outages) will be automatically shared with the relevant field managers for immediate remedial action.
- Account Class Visibility: Accounts with the Customer_Class__c = 'Industrial' category will be shared with the "Enterprise Support" team because they require special handling that differs from retail customers.

b) Owner-Based Sharing:

All Work Orders created by support agents are automatically shared with dispatchers in the same geographic area for fast scheduling.

c) Public Read-Only for Knowledge Base:

All technical problem-solving articles (Knowledge Base) are set to Public Read-Only so that all departments can provide consistent answers to customers.
