GreenGrid Project: End-to-End Salesforce Transformation Proposal

- **Prepared by** : Dinda Suci Indah Sari (Lead Salesforce Business Analyst)
- **Client** : GreenGrid Utilities
- **Vision** : Eliminating operational silos to create smart, sustainable, and customer-centric energy services.

M6. Automation Design With Salesforce

This automation strategy is designed to achieve the company's SMART goals, specifically reducing case handling time (AHT) by 20% and ensuring no leads are overlooked.

6.1 Flow Design

We will implement three main workflows using Record-Triggered Flow to ensure lightning-fast responses to data changes.

1. GreenGrid Lead Distribution Engine:

- Purpose: Ensure every lead from the web goes directly to the right agent.
- Logic: Classify leads based on Customer_Class__c (Retail vs. Industrial) and geographic region.

2. SLA Guardian Escalation Flow:

- Purpose: Ensure compliance with the Service Level Agreement (SLA) for customer complaints.
- Logic: If a "High" priority case (such as an outage) is not responded to within 2 hours, the system will automatically escalate.

3. Smart Service Request Router:

- Purpose: Automate the creation of Work Orders for field repairs as soon as an outage is detected.

6.2 Workflow Documentation

Here are the technical details of the designed workflow:

A. Flow: Automated Lead Assignment

1. **Trigger:** When a new lead is created via a web form (Web-to-Lead).
2. **Decision Points:**
 - Is Customer_Class__c "Industrial"?
 - If yes, check whether the region is "West" or "East."

Andalas University

3. Actions:

- Industrial-West: Assign to the "Enterprise Sales West" queue.
- Industrial-East: Assign to the "Enterprise Sales East" queue.
- Retail: Assign in a round robin fashion to the Retail Sales team.
- Notification: Send an automated email to the owner of the new lead.

B. Flow: Case Escalation

1. **Trigger:** When a Case object is created or updated with Priority = "High".

2. **Decision Points:**

- Is the case status still "New" after 2 hours?

3. **Actions:**

- Update the Status field to "Escalated".
- Send a Chatter notification to the Support Supervisor.
- Send an SMS alert to the on-duty field technician via mobile integration.

C. Flow: Service Request Routing

1. **Trigger:** When a Case of type "Maintenance" or "Outage" is closed with a resolution requiring a field visit.

2. **Decision Points:**

- Does the customer's location have valid Geo_Location__c data?

3. **Actions:**

- Automatically create a Work Order object and link it to the originating Case.
- Notify the Dispatcher via the Field Service console.

6.3 Error Handling Strategy

To ensure the LumiGrid system remains resilient, we will implement the following "Fail-Safe" strategies:

- **Fault Connectors:** Each crucial element in a Flow (such as Create or Update Records) will have a "Fault" path. If a technical error occurs, the flow will be redirected to this path instead of stopping completely.
- **Custom Error Logging:** We will create a custom Automation_Log__c object. If a Flow fails, the error details (including the record ID and technical error message) will be automatically logged here for easy auditing by the IT team.
- **Admin Instant Alert:** The system will send an emergency email to the Salesforce Administrator with a direct link to the Flow element causing the error, allowing for remediation within minutes.
- **Validation Rules Consistency:** Ensure all criteria in the Flow align with the validation rules on the object (such as the requirement to fill a meter serial number) to prevent Flow execution failures due to data rejection.
