GreenGrid Project: End-to-End Salesforce Transformation Proposal

- **Prepared by** : Dinda Suci Indah Sari (Lead Salesforce Business Analyst)
- **Client** : GreenGrid Utilities
- **Vision** : Eliminating operational silos to create smart, sustainable, and customer-centric energy services.

M2. Current State Assessment and Requirements Gathering

2.1 Process Mapping

Currently, GreenGrid Utilities operates in a fragmented ecosystem, where data is scattered across legacy tools and spreadsheets. Here's a mapping of the current process:

a. Lead Management:

- Leads come in via phone or a static website form.
- Data is manually copied into a Sales team spreadsheet.
- There is no qualification automation; leads often go cold before being contacted due to data entry lag.

b. Opportunity Tracking:

- New contract approvals are done manually via email or physical signatures.
- Managers lack real-time visibility into the sales pipeline, resulting in inaccurate revenue projections.

c. Customer Account Management:

- Customer data is duplicated across legacy billing systems and service spreadsheets.
- Address or contact changes in one system do not update the other, resulting in billing failures.

d. Service Case Handling:

- Service cases (such as power outages) are received over the phone, but support agents do not have access to field repair history.
- Technician scheduling is done manually via phone or text message, without location-based coordination.

2.2 Stakeholder Interviews

Intensive interviews revealed critical obstacles hindering the company's growth:

- **VP of Global Sales:** *"We're missing out on potential energy contracts because our team spends 40% of their time searching for data in different spreadsheets."*
- **Head of Customer Success:** *"Customers are frustrated because our agents keep asking the same questions over and over. We need a unified view of the customer."*

Andalas University

- **Field Dispatcher:** *"I don't know which technician is closest to the outage. Everything is manual, and phone coordination is very time-consuming."*
- **CIO:** *"Our data security risk is very high because sensitive customer data is in employees' local Excel files. We need to centralize it in Salesforce."*

2.3 Stakeholder Analysis Matrix

The following are the details of the validated requirements to support the "Project LumiGrid" vision:

a. Business Requirements

- **BR-01:** The system must provide a Single Source of Truth for customer data to eliminate 100% of duplication.
- **BR-02:** Reduce monthly reporting time from 5 business days to seconds through an automated dashboard.
- **BR-03:** Increase the First-Time Fix Rate of field technicians by 15% through real-time data access.

b. Functional Requirements

- **FR-01 (Web-to-Lead):** Automatic integration of website forms into Lead objects in Salesforce to accelerate sales responses.
- **FR-02 (Omni-Channel):** Service cases should be automatically created and distributed to agents based on expertise (e.g., billing specialist vs. technical specialist).
- **FR-03 (Field Service Mobile):** Technicians should be able to update Work Order statuses and take photos of repairs directly from their mobile devices.
- **FR-04 (Self-Service Portal):** Customers should be able to view billing status and report outages independently through Experience Cloud.

c. Non-Functional Requirements

- **NFR-01 (Security):** Implementation of data encryption and compliance with national utility data privacy regulations.
- **NFR-02 (Scalability):** The system architecture must be able to handle customer growth of up to 200% without performance degradation.
- **NFR-03 (Availability):** The system must be accessible 24/7 with a minimum uptime of 99.9%.
